

Hennepin County SNAP Penetration Analysis

Group Watermelon

Mark Chen, Farhad Mughal, Xinbo Wang, Weizhong Yao

Introduction

Gauge monthly SNAP penetration rate by tract and by race.

Hard to keep track of lower level eligibility information

- Data cleaning and adjustment using different external data sources* for **penetration calculation**.
- Interactive **dashboard** to map penetration difference geographically and demographically.
- Statistical analysis to provide **insights** of penetration.
- Practical **recommendations** for developing strategies.

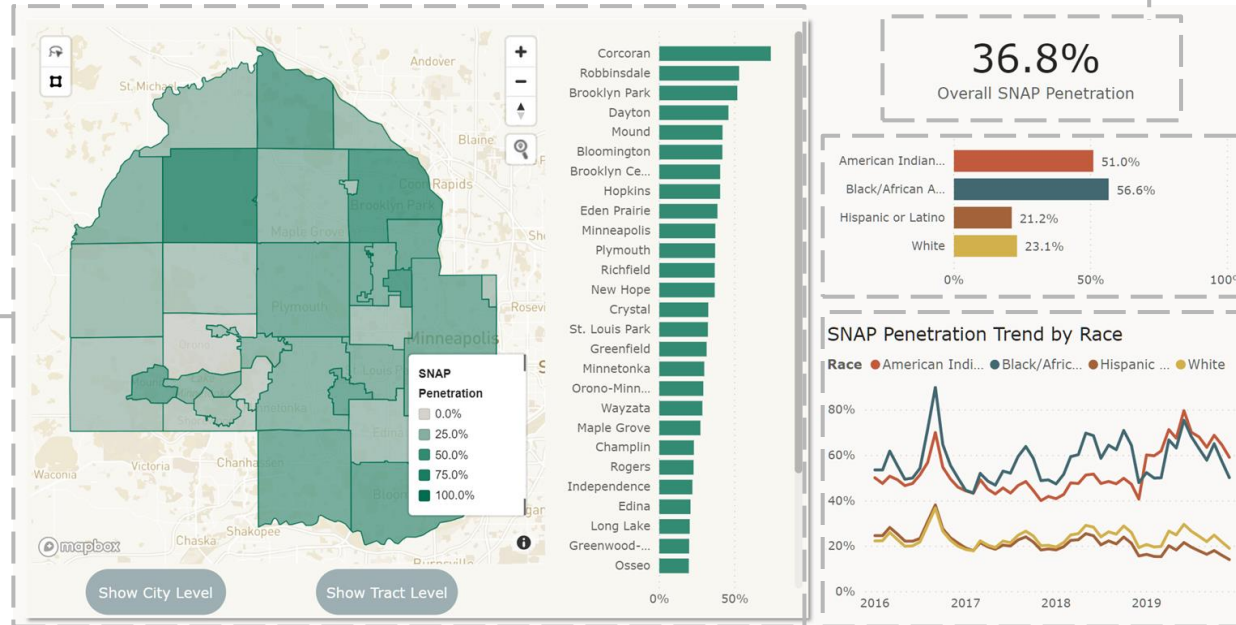

*External data source

- ☐ American Community Survey (ACS5 & ACS1)
- ☐ Basic Monthly Current Population Survey (CPS)
- ☐ SNAP Retailer Locator data

Understand SNAP penetration from different perspectives

Main Performance Indicator:
SNAP Penetration

Geographical Breakdown:
by Cities and Tracts

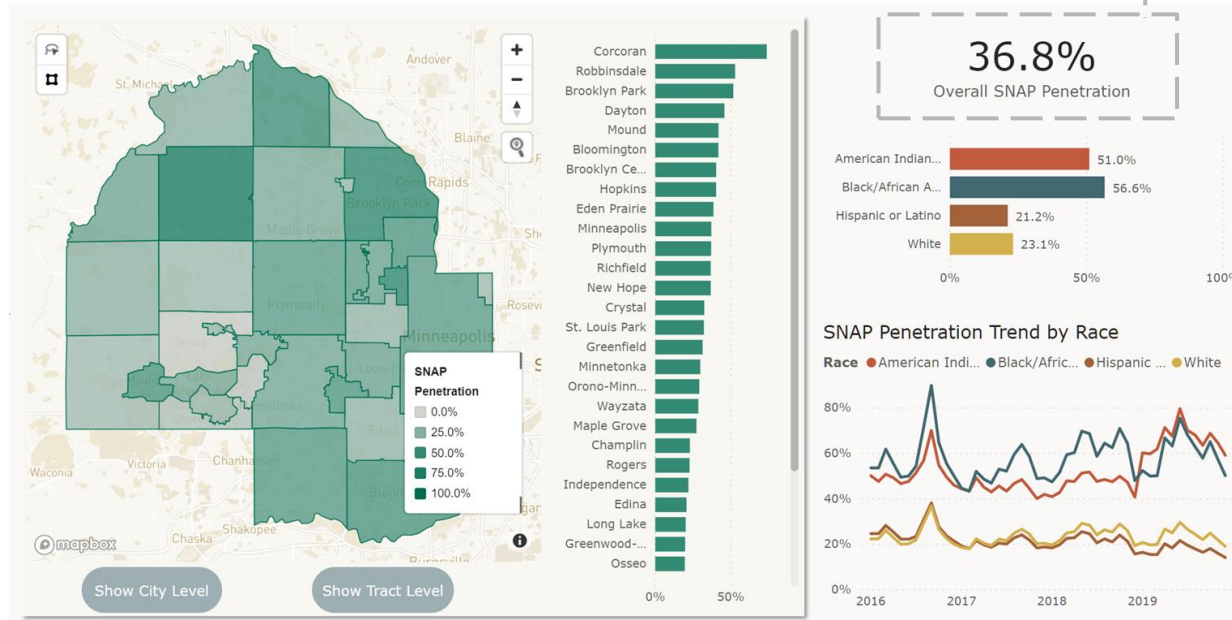

Demographic Breakdown:
by Race

Time Series
to monthly
performance

Calculating Penetration Rate Accurately is the Key

Main Performance Indicator:
SNAP Penetration

Methodology: Estimate Eligible People Accurately

$$\text{Penetration Rate} = \frac{\text{Registered People}}{\text{Eligible People}}$$

Data Provided by Client

Estimated by External Data

Challenges:

1. Complexity in SNAP eligibility criteria
2. No data source with all dimensions matching the registered people data (especially the monthly time level)

Assumptions:

1. 125% of poverty level approximates eligibility well
2. Differences between time windows apply to areas and races equally (explained later)

Leverage Multiple Data Sources to Estimation Eligible People Accurately

ACS5 Data,
Population under
Poverty Line by
Tract and Race

Adjust to Population
under 125% of
Poverty Line, closer
to actual criteria

Incorporate
Changes in
Population and
Income Over Time

**A Realistic
Estimation of
Eligible People, on
Monthly Level**

Example: Tract 104800, Black/African American

Starting Point

Adjust to 125% Poverty Line

Adjust by Yearly Change in
Total Population

Adjust by Monthly Change in
Estimated Eligible Ratio from CPS

Data Source: ACS5

ACS5

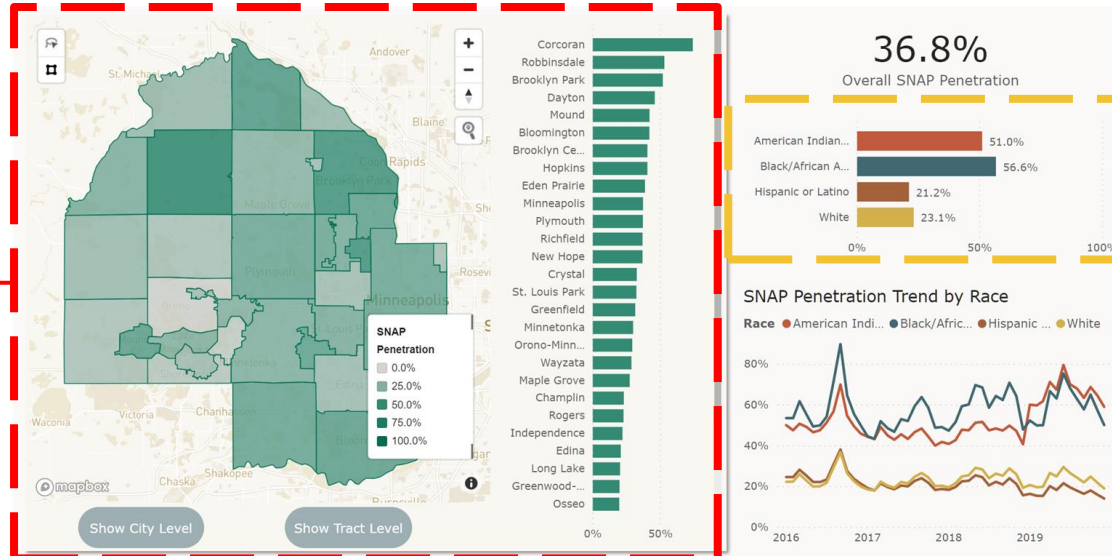

ACS1

CPS

Penetration Varies in Different Areas. Why?

More store access, higher penetration?

Different penetration in different race groups?

Higher Store Density, Higher Penetration

Positive association highly likely exists.

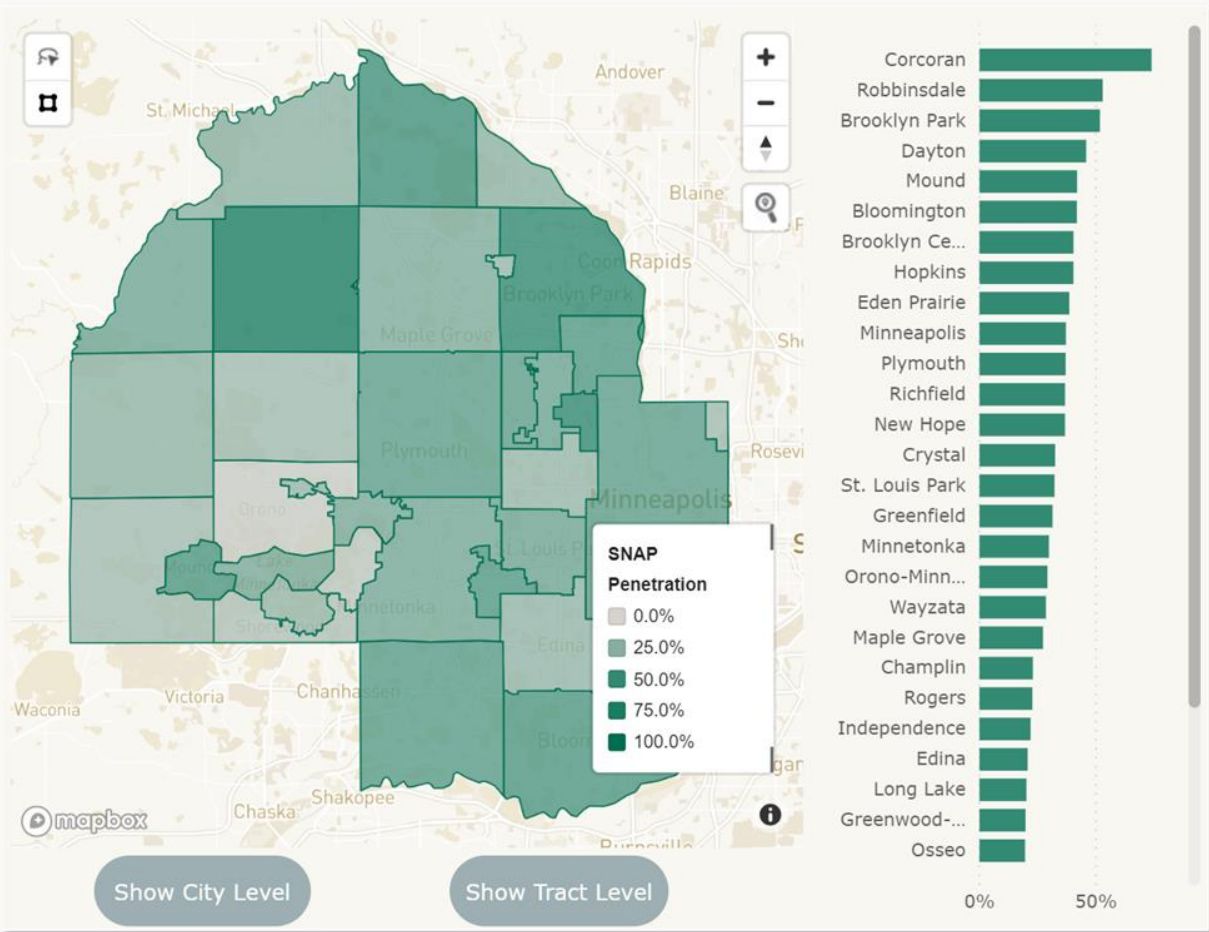

**SNAP
Store
Density**

Penetration

Store Density = SNAP Store Number / Area of The City (km2)

Updated to
December, 2019

Hennepin County SNAP Penetration Overview

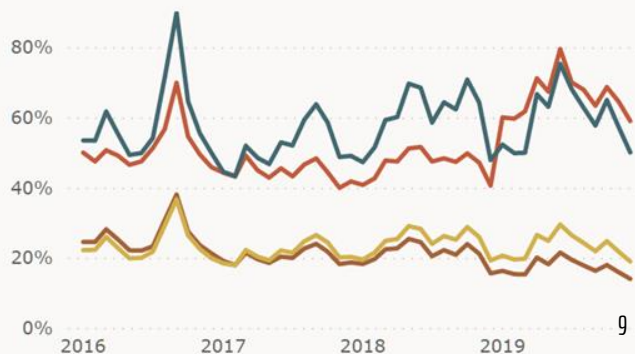

36.8%
Overall SNAP Penetration

SNAP Penetration Trend by Race

Race ● American Indi... ● Black/Afric... ● Hispanic ... ● White

Intra - Race SNAP Penetration Comparison

African American have the highest SNAP penetration while Hispanic & Latino have the lowest penetration

- Previously, as per USDA survey, penetration in SNAP program was higher in certain groups like Hispanic & Latino and white which has been declined in recent years
- Yearly as well as monthly penetration drop in SNAP penetration for these groups might be suggestive of some underlying phenomenon

Recommendations & Way Forward

- Conduct surveys and experiments to investigate reasons of
 - Low penetration in some racial groups while also explore the reasons of current low penetration in historically high SNAP penetrated segments
- Explore policies for getting more stores to adopt SNAP in low density areas
 - Further research to confirm the causality between store density and penetration.
- To Conduct further analysis across different demographics
